This isn't so much a ReactJS question as it is a general application testing question. Here are the setup details: I'm using Gatsby to create my React application with webpack to pack my application down into static assets. I'm using react-router to redirect to different paths within my application, and I'm using redux to handle my app's state. I'm a bit of a JavaScript newbie so I'm having a hard time testing my application. I need to be able to test that a form field is filled out for my user. Here is my form code: import React, { Component } from "react"; import "../props.css"; class ContactUs extends Component { submit = () => { // I need to submit my form here, when the user is // visiting the Contact Us page. This is my first // attempt, but it doesn't seem to work. } render() { return (
